

AIR SANITIZING & SELF CLEANING

Imagine systems and technologies which could help protect your family and prevent the common cold, influenza, asthma, allergies, irritation of the eye, sinus, and skin, as well as fatigue, headaches, nausea, chicken pox, measles, bronchitis... and so much more.

Cleaning the air inside your home or business reduces, or completely eliminates, air born micro-organisms which can cause the listed conditions.

Filters can not do this! Any filter used to catch organic matter as it enters into your central heating or a/c system only provides a spawning ground for organic bionesting. The more restrictive or efficient the filter is the more concentrated the bionesting.

Organic bionesting is not only occurring on standard filtration systems but is also much more prevalent on the surface of your systems evap coil. All of this organic loading sends a plethora of byproducts into the duct system to be reintroduced into your breathable air.

This accumulation of organics also causes air flow restrictions which greatly affect the operating efficiency of your central heating and a/c system.

By  **GREEN.X**-sanitizing your home all past sources of contamination will be eliminated and sealed. By upgrading your Central heating and A/C system to **self cleaning** prevents the contamination from returning, increasing system efficiency and longevity and, oh by the way, allows you to **throw those filters away**.
